

Our B2B offer

Outsourcing the development of electronic products

At [audiodevel](http://audiodevel.com) we work on our own developments as well as on orders from our B2B clients. If you plan to outsource and need expertise for a fixed and reasonable price, we offer the entire product development cycle - from idea to industrialisation - for a wide range of digital and analog electronics.

How we work:

We use a strict and transparent requirement management to be able to identify your product needs accurately and in all details, so that we can offer a fixed price for a well defined project. Once you accept our offer, no hidden or additional costs will be charged for your project. If not wished for otherwise, all agreements are made under German law and jurisdiction.

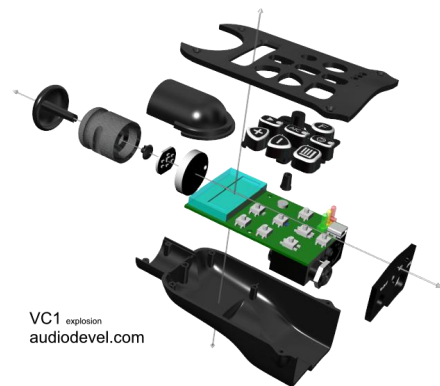

What we develop: (For more detailed information, please get in contact.)

- ▶ Embedded systems based on ARM, Intel and TI DSPs
- ▶ Firmware for above products, based on Bare Metal, FreeRTOS or Linux.
- ▶ Product related software for Windows, macOS and Linux
- ▶ Low noise mixed signal electronics and PCB layout (e.g. for professional audio)
- ▶ IoT hardware, including virtually all types of sensors

What we can do more:

If wanted, we can arrange small series productions. If you need big numbers, we can help you in the industrialisation process until production is up and running.

In our second residence, Portugal, we are in contact with a buzzing network of qualified and trusted Portuguese engineers. In case your project is in need of Industrial Design, Robotics or Mechanical Engineering as well, please tell us, we might be able to help.
